The University of Dublin

Limbic System Development in Children and Adolescents with Attention Deficit/Hyperactivity Disorder: A Longitudinal Multimodal MRI Analysis

Volume 2 of 2

Michael Connaughton

School of Medicine and Trinity College Institute of Neuroscience
Trinity College Dublin, University of Dublin

A thesis submitted to
Trinity College, University of Dublin
For the degree of
Doctor of Philosophy

Supervisors:

Prof. Jane McGrath

Prof. Robert Whelan

Dr. Erik O'Hanlon

2024

Declaration

I declare that this thesis has not been submitted as an exercise for a degree at this or any other university and it is entirely my own work.

I agree to deposit this thesis in the University's open access institutional repository or allow the Library to do so on my behalf, subject to Irish Copyright Legislation and Trinity College Library conditions of use and acknowledgement.

I consent to the examiner retaining a copy of the thesis beyond the examining period, should they so wish (EU GDPR May 2018).

Signed: Michael Connaughton

A handwritten signature in black ink, appearing to read "Michael Connaughton".

Date: 12/02/24

1.5. Additional Analyses: ADHD-Associated Brain Regions

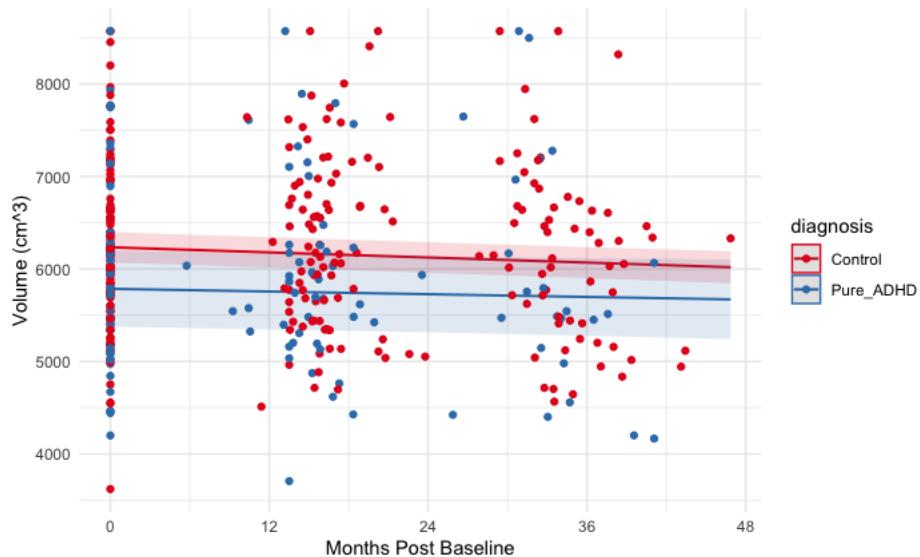

Additional analyses were performed to examine the between-group differences in brain regions outside the limbic system that have been associated with abnormalities in ADHD, specifically components of the basal ganglia, inferior prefrontal cortex and dorsolateral prefrontal cortex. To measure between-group differences in volume, LMM was used via the lme4 package in R (version 1.1-27.1)(Bates et al. 2014). The chosen LMM model is illustrated as model FX2b in Table 1.

Secondary analyses were also conducted to investigate the relationship between these brain volumes and ADHD symptoms (CAI and ARI) in children and adolescents with ADHD. These relationships were investigated using LMM via the lme4 package in R (version 1.1-27.1)(Bates et al. 2014). The selected LMM model, depicted as model FX3b in Table 1, assessed whether age-related volume changes in these structures varied based on ADHD symptom severity, by including an age-by-ADHD symptoms interaction term. To minimize the impact of multiple comparisons, a two-stage FDR correction was conducted using the MuToss package(Team et al. 2017) in R (v.4.1.1).
